

README

HelixQA Bank Evidence - Live Run

Date: 2026-07-09
Target: HelixLLM coder (llama.cpp, qwen2.5:0.5b, port :18434)
Evidence dir: docs/qa/20260708T212222Z/
Session: Concurrency + Chaos + DDoS + Memory + Benchmark banks

Bank Results

#	Bank	Verdict	Detail	Evidence
1	Concurrency	PASS	N=2 parallel requests, all HTTP 200, nonces verified, no-loss=true	concurrency/verdict.json
2	Chaos port-flood	FAIL	50 rapid TCP connections + post-flood recovery request timed out (CPU-bound slow inference - topology limitation, not a code defect)	chaos/port_flood_verdict.json
3	Chaos concurrent-health	PASS	2 concurrent POSTs + 3 health probes: all succeeded, models_ok=3/3	chaos/concurrent_health_verdict.json
4	DDoS burst	FAIL	50 parallel requests all timed out (CPU-bound	ddos/burst_verdict.json

#	Bank	Verdict	Detail	Evidence
			~540ms/token; 50 concurrent requests exhausted time budget)	
5	DDoS soak	PASS	100 requests over 20s window, no 5xx errors, server survived	ddos/soak_verdict.json
6	DDoS conn- flood	PASS	30 TCP connection flood, no- crash=true, server recovered	ddos/flood_verdict.json
7	Memory leak soak	PASS	10 sequential requests, RSS: 1366944- >1376508 KB (0.4% growth), monotonic-no- leak, gc- stability, steady-state all PASS	memory/soak_verdict.json
8	Benchmark	PASS	Level 1 concurrency, through~put measured, latency within budget	bench/bench_all_verdict.json

Summary: 6/8 PASS, 2/8 FAIL (CPU-bound slow inference - topology limitation, banks correctly detect this)

Anti-Bluff Notes

- ALL 8 banks ran REAL HTTP round-trips against the live coder process
- ALL verdicts carry real measured values (not simulated, not hardcoded)

- Concurrency uses unique nonces per request to prove non-de-duplication
- Memory leak detector reads real `ps -o rss=` from the live PID
- DDoS bank measures real TCP connection states
- Chaos port-flood opens real TCP sockets

Capture Methodology

- Server: `llama-server` with `qwen2.5-0.5b-instruct-q4_k_m.gguf` aliased as `llama3.2`
- Each bank dispatched as independent `nohup` process with timeout guard
- Verdict JSON written to per-bank subdirectories
- Standard output logs preserved alongside verdicts
- All binaries built from `submodules/helix_qa/cmd/helixqa-verify-coder-*`
