

README

HelixCode User Manual Documentation System

This directory contains the HelixCode user manual and related documentation tools.

Overview

The HelixCode documentation system provides:

- **Styled HTML Manual:** Professional, responsive HTML version with search and navigation
- **Automatic Sync:** Scripts to sync manual to GitHub Pages Website
- **Markdown to HTML Conversion:** Go-based converter for custom Markdown processing
- **PDF Generation:** Optional PDF export using wkhtmltopdf

Files and Directories

```
docs/user_manual/  
├── manual.html           # Main HTML manual (styled and interactive)  
├── images/              # Supporting images and assets  
└── README.md            # This file
```

Scripts

1. Generate Manual (**scripts/generate-manual.sh**)

Generates the HTML manual from README.md using the Go-based converter.

```
cd HelixCode  
./scripts/generate-manual.sh
```

Features: - Converts Markdown to beautifully styled HTML - Generates table of contents automatically - Adds syntax highlighting - Creates responsive layout

2. Sync Manual (**scripts/sync-manual.sh**)

Syncs the generated manual to the GitHub Pages Website.

```
cd HelixCode
./scripts/sync-manual.sh
```

Features: - Copies manual.html to GitHub-Pages-Website/docs/manual/index.html - Copies all images to the destination - Generates PDF version (if wkhtmltopdf is installed) - Creates README and metadata files - Logs all operations to scripts/sync-manual.log - Checks for git changes and provides commit commands

3. Markdown to HTML Converter (**scripts/md-to-html**)

Go program that converts Markdown to styled HTML.

```
cd HelixCode/scripts
./md-to-html -input=../README.md -output=../docs/user_manual/
manual.html
```

Options: - -input: Input Markdown file (required) - -output: Output HTML file (required) - -title: HTML document title (default: “HelixCode User Manual”) - -theme: Theme (light/dark, default: “light”)

Manual Features

The generated HTML manual includes:

Navigation

- Fixed header with logo and search
- Sidebar table of contents with jump links
- Smooth scrolling to sections
- Active section highlighting

Styling

- Professional CSS matching GitHub Pages website theme
- Responsive design (mobile-friendly)
- Light/Dark theme toggle
- Syntax highlighting for code blocks (highlight.js)
- Custom alert boxes (info, warning, danger, success)

Functionality

- Full-text search across documentation
- Mobile menu toggle
- Automatic anchor links for headings
- Interactive TOC with active state
- Timestamp generation

Workflow

Complete Documentation Update Workflow

1. **Update Content:** Edit README.md or create content in docs/user_manual/
2. **Generate Manual** (optional if using pre-built manual.html):

```
./scripts/generate-manual.sh
```

3. **Sync to GitHub Pages:**

```
./scripts/sync-manual.sh
```

4. **Review Changes:**

- Check the log file: scripts/sync-manual.log
- Review generated files in github_pages_website/docs/manual/

5. **Commit and Push:**

```
cd ../Github-Pages-Website
git add docs/manual/
git commit -m "Update user manual - $(date)"
git push
```

PDF Generation

To generate PDF versions, install wkhtmltopdf:

macOS

```
brew install --cask wkhtmltopdf
```

Linux

```
sudo apt-get install wkhtmltopdf
```

The sync script will automatically generate PDFs if wkhtmltopdf is available.

Customization

Updating Styles

The HTML manual includes embedded CSS. To update styles:

1. Edit the `<style>` section in `manual.html`
2. Re-run the sync script to deploy changes

Adding Images

1. Place images in `docs/user_manual/images/`
2. Reference them in the manual with relative paths
3. The sync script will automatically copy them to GitHub Pages

Custom Themes

Edit CSS variables in `manual.html`:

```
:root {  
  --primary-500: #0ea5e9;      /* Primary color */  
  --accent-1: #10b981;        /* Success color */  
  --accent-2: #f59e0b;        /* Warning color */  
  --accent-3: #ef4444;        /* Error color */  
  /* ... */  
}
```

Troubleshooting

Issue: “manual.html not found”

Solution: Run `./scripts/generate-manual.sh` first

Issue: “GitHub Pages directory does not exist”

Solution: Ensure Github-Pages-Website is cloned at the same level as HelixCode

Issue: “PDF generation failed”

Solution: Install wkhtmltopdf or skip PDF generation (manual will still sync)

Issue: “Permission denied”

Solution: Make scripts executable:

```
chmod +x scripts/*.sh
```

Integration with Website

The manual is automatically integrated with the GitHub Pages website:

- **URL:** `https://your-username.github.io/github_pages_website/docs/manual/`
- **Location:** `docs/manual/index.html`
- **Assets:** `docs/manual/images/`
- **PDF:** `docs/manual/HelixCode_User_Manual_Latest.pdf`

The manual inherits the website’s design language and theme.

Version Control

The manual tracks: - Generation timestamp (automatically added) - Sync metadata (`.sync-metadata.json`) - Version number (from README.md or manual metadata)

Future Enhancements

Potential improvements: - ☐ Watch mode for automatic regeneration - ☐ Multi-language support - ☐ Version history and changelog - ☐ Interactive examples and demos - ☐ API documentation integration - ☐ Search index generation

Support

For issues or questions: - GitHub Issues: <https://github.com/HelixDevelopment/Helix-CLI/issues> - Documentation: <https://docs.helixcode.dev>
