

MORNING_RESUMPTION_20260712

Morning Resumption — helix_code overnight autonomous session (2026-07-12)

Short resume prompt: Read this file + .superpowers/sdd/discovery_sweep_progress.md, then `git fetch --all`. HEAD = f96fadbd on feature/helixllm-full-extension (all pushed, all 3 mirrors), build STABLE. The SSoT DB docs/workable_items.db is the authoritative status — **12 Queued** remain. Continue the endless loop: pull the highest-priority Queued item, fix it as a gated source increment (full make verify-compile + tests + independent review → commit → push ff-only no-force → close it in the DB via the fixed workable-items tool with a diff=0 gate), repeat. NEVER commit a closed item without its source fix (the HXC-132 index.lock race lesson — always verify git status post-commit).

SESSION-2 COMPLETE STATE (operator-authorized unblock program fully executed)

Both F-DBTOOL bugs fixed cross-repo (constitution 0fcc00b, all 7 mirrors) + CONST-040 Phase-2 (HXC-117/118/119) + infra full-suite (rootless-podman, security 272 PASS, evidence docs/qa/infra_fulltest_20260712/) + infra/submodule defect fixes. ~24 helix_code commits + 3 constitution commits, all pushed. **Closed this session:** HXC-115/116/120/121/123/124/125/127/128/129/130/132/133/137 (fixed/completed) + HXC-044/131 (obsolete). **12 REMAINING Queued** (fix these in the loop): HXC-117/118/119 (CONST-040 Phase-3 full user-visibility — needs LLMsVerifier service to emit caps / durable vector index / ACP Phase-5 permission-map), HXC-122 (run infra-gated tests now that HXC-132 made server URL configurable), HXC-126 (move-drift — date-preserving relocate of section rows stuck in Issues; F-DBTOOL tool is clean now), HXC-134 (llms_verifier model_id int64 → string, submodule), HXC-135 (llms_verifier emit capability keys, submodule), HXC-136 (ddos/scaling/stress/ui/ux test-types), HXC-138 (e2e challenge exec — needs a running server), **HXC-139 (High: helix_agent vendored Continue fixture breaks module build — isolate the non-Go fixtures)**, HXC-140 (helix_qa mutex-copy + testbank fail), HXC-141 (mcp_module Docker-adaptor nil-ptr on stop-not-started). Operator decision still open: whether to open an item for Aurora/HarmonyOS targets.

LATEST STATE (operator returned mid-session + authorized unblocks — 2026-07-12 later)

The F-DBTOOL “morning steps” section below is now MOSTLY DONE — superseded by this: - **F-DBTOOL-1 LANDED cross-repo:** constitution 3302587 (representation-scoping fix + regression test) pushed to all 7 mirrors; helix_code 7ce471ee bumped the pointer + applied the copy-validated hygiene subset → **closed HXC-125/127/129 + backfilled 79 severities**, DB diff=0/validate OK. - **F-DBTOOL-2 LANDED:** constitution 0fcc00b (update –description no longer re-renders table-rep bodies + regression test) pushed all mirrors; helix_code applied the 31 descriptions → **closed HXC-128**, DB diff=0. Only **HXC-126 (move-drift)** remains — a *separate* location-normalization (section rows stuck in Issues), not a tool bug; needs a date-preserving relocate. - **CONST-040 Phase-2 LANDED** (edbd5a49): HXC-117 (verifier caps from real LLMsVerifier path; honest: live service doesn’t emit keys yet), HXC-118 (real Ollama-embedder RAG retriever + default-OFF handleGenerate hook), HXC-119 (ACP Prompt → real GenerateStream). All additive/opt-in, full build green. **HXC-117/118/119 stay Queued** (Phase-2 landed; full user-visibility needs: LLMsVerifier service to emit caps / a durable vector index / ACP Phase-5 permission-map). - **Infra full-suite COMPLETE:** rootless-podman 17-container stack, teardown clean; **security 272 PASS**, memory 3, integration 189-pkg-ok (evidence docs/qa/infra_fulltest_20260712/). HXC-122 = infra boots + tests run (the skip-by-default gap is server:8080 hardcoding — a test-config fix). Surfaced 6 defects. - **W5 infra-defects FIXED** (eb233785): Azure NewAzureProvider nil-ptr SIGSEGV (endpoint-trim + hermetic test), stale test/integration reconciled to current API, e2e runner -all flag added. make verify-compile GREEN. - **REMAINING FOLLOW-UPS (all documented, none blocking the build):** HXC-126 move-drift (date-preserving relocate); HXC-124 HelixQA TokenField: "token" consumer fix (root-caused in the infra SUMMARY); INFRA-4 cognee auth/bearer drift; INFRA-5 compose Dockerfile.test path + server:8080 test-config; HXC-117/118/119 full user-visibility (LLMsVerifier service to emit caps / durable vector index / ACP Phase-5 permission-map); Aurora/Harmony needs operator confirm on opening a new item. - **HXC-108 correction:** it’s a *Completed Video-QA task*, NOT the Aurora/Harmony item the old prompt claimed — took no action; Aurora/Harmony has no formal open item (scaffolds only under applications/{aurora_os,harmony_os}).

State at handoff (all evidence-backed, zero bluff)

- **HEAD:** ca76e14b feature/helixllm-full-extension; **all 3 mirrors (github/gitlab/upstream) at ca76e14b** (ff-only, no force ever). main untouched on remotes (6bf1be7) — feature is ahead by 2 commits (\$11.4.167 no-merge-until-approved).

- **Build: STABLE.** `make verify-compile (nogui full build) = “ All packages compile successfully”` at HEAD. Anti-bluff scan clean. mock-in-production 0.
- Five commits landed + pushed tonight (all 3 mirrors, ff-only no-force), each fully tested + independently reviewed + captured-evidence:
 - 3d3f3326 wave-1: 6 fixes (HXC-115 CONST-046 gate portability, HXC-120 CORS stale-test, HXC-121 provider tests, HXC-123 security_scan tests, HXC-116 multitrack runbook, HXC-130 GUI build-env doc) + 16-item backlog materialized (HXC-115..130). Evidence: docs/qa/discovery_hardening_20260711T212548Z/.
 - ca76e14b wave-2/3 source: HXC-117 Phase-1 (6 verifier CONST-040 capability fields), HXC-119 Phase-1 (ACP scaffold via coder/acp-go-sdk v0.13.5 — helixcode acp opt-in stdio cmd, real handshake tests), HXC-125 (make test-integration-tag, 123 PASS), + W2-A design doc. Evidence: docs/qa/discovery_hardening_wave2src_20260711T220325Z/.
 - 52b41448 this handoff doc. 54a76c3c HXC-118 Phase-1 RAG adapter (internal/rag, default-OFF, 5 tests). d0be2462 F-DBTOOL ROOTCAUSE doc.

Deep-analysis verdict (§11.4.118 discovery sweep of the “203-distinct-item, all-terminal” tree)

The system is genuinely real (0 bluff-scan hits, all 10 CONST-039 providers real HTTP, /api/v1/llm/generate|stream wired e2e, 24/25 sampled closed items verified-present, unit 153/153, QA/Challenges suites real+executed). Real gaps found + tracked as HXC-115..130.

F-DBTOOL — ROOT-CAUSED + FIXED + TESTED (validated), ready for a 2-minute operator commit

Root cause (see docs/research/f_dbtool_20260712/ROOTCAUSE.md, committed): the workable-items schema PK is (atm_id, current_location, representation), but loadItem + update/close/reopen/block/obsolete-details scoped their WHERE by only (atm_id, current_location) — IGNORING representation — so on the one dual-representation item (HXC-044) an edit clobbered BOTH the section and table rows, and a glue/newline bug then corrupted ~188 downstream items’ parse → the 176–190 DB ↔ MD diff explosion. **FIX (validated, UNCOMMITTED in the constitution submodule working tree):** constitution/scripts/workable-items/cmd/workable-items/{crud,db,mutate,obsolete}.go scope every WHERE by representation + fix the glue/idempotency bugs; + regression test f_dbtool_representation_scope_test.go (3 tests incl. a load-bearing

reproduce-first proof). Tool go test -count=3 ./... PASS; re-running the exact repro on a live-DB **copy** now gives diff: DB and Markdown are in sync (was 190). **Why not committed overnight (zero-risk §11.4.101):** the constitution submodule is 1 commit BEHIND remote main (91aa99d vs c793ba6) with 8+ upstream mirrors; committing to the canonical-root repo that cascades to every project is highest-blast-radius — left for operator awareness. **MORNING STEPS to land F-DBTOOL (each low-risk):** (1) cd constitution && git pull --ff-only origin main (integrate the 1 upstream commit; resolve if it touched workable-items). (2) commit the 5 files (4 fix + 1 test, scripts-only, NOT git add -A) + push ff/no-force to all constitution mirrors (§11.4.113). (3) cd ..; git add constitution && commit the pointer bump. (4) rebuild wi from the fixed source; on a DB **copy** re-apply the wave-2 hygiene (close HXC-125; obsolete-details+close HXC-127; apply+close HXC-128 descriptions + HXC-129 severities from scratch/discovery/fixes/W2C_hygiene_proposals.jsonl) → validate + diff=in-sync → repeat on live docs/workable_items.db → export → commit helix_code (DB+trackers) + push. **HXC-117/118/119 stay Queued** (Phase-1 only — do NOT close them, that would be a bluff). **The live DB is currently CLEAN + in-sync — safe to leave as-is.**

Items with SOURCE landed but DB still shows Queued (DB-close deferred per F-DBTOOL — honest)

HXC-117, HXC-119 (Phase 1 each), HXC-125, HXC-127/128/129 (hygiene reverted). The W2C hygiene proposals (31 descriptions + 79 severities, validated) are saved at scratch/discovery/fixes/W2C_hygiene_proposals.jsonl for careful re-apply once F-DBTOOL is fixed.

In flight at handoff

- W3-118 (RAG adapter Phase 1, internal/rag) — running (agent a5b59e8fbe2612032).
- D2 (owned-submodule build/vet/test audit → Phase F) — long-running; may not have completed.

Remaining backlog (Queued in DB)

HXC-118 (RAG — Phase 1 in flight; Phase 2 = cmd/cli wiring), HXC-119 (ACP Phase 4 turn-gen + Phase 5 permission-map — SECURITY-SENSITIVE, needs review, do not rush overnight), HXC-117 (Phase 2 = wire mcp/lsp/skills/plugins to read verifier flags), HXC-122 (memory/automation infra-gated tests — needs make test-infra-up), HXC-124 (HelixQA JWT-mint gap — submodule + security), HXC-126

(tracker move-drift — needs F-DBTOOL fix), plus Phase F submodule findings from D2, plus **F-DBTOOL itself**.

Binding constraints (unchanged)

Anti-bluff §11.4; no force-push §11.4.113 (ff-only, merge-onto-latest-main); source-only commits gated by full `make verify-compile + tests + independent review`; workable-items DB frozen until F-DBTOOL fixed; feature branch only, never main.

Sources verified 2026-07-12: local git (`git ls-remote`), `make verify-compile`, `wi validate/diff`.
