

background_queue

Background Work Queue (§11.4.140 BACKGROUND action, v2)

Revision: 1 **Created:** 2026-07-29 **Last modified:** 2026-07-29T00:30Z **Status:** active
Maintainer: CLI-agent main work stream

Durable, append-only, NEVER-dropped queue of BACKGROUND : : requests.

The BACKGROUND action’s expansion is explicit: **the moment** such a request is received it **MUST** be recorded here — with an id, a received-timestamp, a status and any blocker — so it can never be lost, dropped, or forgotten. It **MUST** then be executed: subagent-driven in parallel with all main work if capacity exists, otherwise left Queued with its blocker recorded, retried at the next opportunity **including the next fresh session**, and re-surfaced to the operator every session until it reaches a terminal state (Done or Operator-cancelled).

Two rules that shape this file:

- **Non-interrupting (v2).** A BACKGROUND request runs in PARALLEL with the main stream and must NOT interrupt, block, preempt, or divert it. If no genuine background capacity exists, the request stays Queued here rather than being run inline — running it inline would violate the action’s purpose.
- **Silently dropping, or deferring-and-forgetting, is FORBIDDEN.**

Composes §11.4.87 / §11.4.94 / §11.4.97 / §11.4.103 / §11.4.126.

		nothing left out; exhaustive phase/task/subtask plan; full §11.4.169 test-type + Challenges + HelixQA coverage; all docs/manuals/guides/FAQs extended with illustrations, graphs and diagrams; every gap/weak-spot/danger-zone detected in advance during planning and paired with a rock-solid risk-free solution; progress tracked through continuation + memory/knowledge mechanisms; GitHub SpecKit for all phases, bridged to Superpowers, subagent-driven.	

Status vocabulary

Status	Meaning
Queued	Recorded, not yet started. A Blocker MUST be stated.
In-progress	Actively running in background, parallel to the main stream.
Blocked	Started or startable but externally blocked; Blocker states what and the retry condition. Re-attempted next opportunity, including next fresh session.
Done	Terminal. Reached a genuinely completed, evidence-backed state (§11.4.197 — never merely acknowledged).
Operator-cancelled	Terminal. Explicitly cancelled by the operator; the reason is recorded.

Honest boundary (§11.4.6): this queue guarantees a BACKGROUND request is never lost or forgotten. It does NOT by itself guarantee the work is correct — each request’s output still crosses the same gates as any other change: independent review (§11.4.142 / §11.4.134), four-layer runtime-signature verification (§11.4.108), and the full-suite retest (§11.4.40).
