

05_branch_registry

Canonical Branch-Name Registry (§11.4.181) — HelixLLM Full-Extension Programme

Purpose	Single source of truth for the ONE canonical feature-branch name (§11.4.181). Every repo touched by this programme uses this EXACT name — never a per-repo variant. Look up here, never re-invent (§11.4.6).
Revision	1 · Created 2026-07-06 · Track (T1/main)

The one canonical name

Axis	Value
Feature slug (§11.4.29 lowercase kebab)	helixllm-full-extension
Branch name (§11.4.167-D / §11.4.181) — identical on EVERY touched repo	feature/helixllm-full-extension
Release tag axis (§11.4.151 prefix = HELIX_RELEASE_PREFIX else helix_code)	<prefix>-<base>-feat-helixllm-full-extension
Logic group	helixllm-full-extension (Phase-R/P complete; Phase 0 → 9 pending)

Repos in scope (each uses **feature/helixllm-full-extension** when branched)

- **main meta-repo** — helix_code (this repo)
- **submodules/helix_llm** — the primary extension target
- **submodules/helix_agent** — provider gateway + adapters + A2A/MCP

- **submodules/llms_verifier** — capability probes + local verification (+ the vendored submodules/LLMsVerifier inside claude_toolkit)
- **submodules/containers** — GPU/compose primitives (upstream PR for the GPU-field gap)
- **submodules/helix_qa** — new capability test banks
- **SIBLING repo** ../claude_toolkit — HelixAgent provider recognition (separate repo, **same** canonical branch name)

Rules (§11.4.181)

1. **One name, everywhere.** Any submodule branched for this programme MUST use feature/helixllm-full-extension — no per-repo drift. An untouched submodule stays on its base branch (not force-branched).
2. **Look up, never re-invent.** Every branch creation reads this registry; a second stream working this group reads the same name.
3. **Risk-free reconciliation.** A mis-named/duplicate branch is reconciled by merge-onto-canonical preserving every commit (§11.4.113 / §9.2), never delete-before-merge, never force-push.

Physical branch creation — DEFERRED (with reason, §11.4.6)

Branches are NOT yet created. This meta-repo runs an **auto-commit daemon** that commits to main (observed: Auto-commit commits advancing HEAD + submodule pointers). Before creating feature/helixllm-full-extension in any repo, INVESTIGATE how that daemon selects its target branch, so a feature branch is not silently committed-over or reset by the daemon (a §11.4.6 unknown — do not guess). Until then: - Research/planning docs (this workspace) remain on main (additive documentation, correctly daemon-committed). - The canonical name is REGISTERED (this file) satisfying §11.4.181's single-source-of-truth requirement. - Physical branch creation happens per-repo at first CODE modification, after the daemon-interaction investigation (tracked as a Phase-0 prerequisite).
