Post-Pull Constitution Validation (§11.4.55) + Fleet Propagation State — 2026-06-22

Scope: READ-ONLY evidence report. No files were edited or committed. **Working dir:** /Volumes/T7/Projects/helix_code **Constitution submodule HEAD:** 4ff4985a1a2f3066ddb271eda0c42dc1f03460c1 (helix_translate-2.3.1-23-g4ff4985) — confirmed source-of-truth contains §11.4.166 (Universal Semgrep static-analysis mandate, 1 hit in constitution/Constitution.md) and §11.4.157 (GEMINI lockstep, 5 hits). Highest anchor in constitution/Constitution.md = **11.4.166**. **§11.4.6 note:** every figure below is verbatim from captured command output; nothing inferred.

STEP 1 — Does the §11.4.55 sweep script exist? YES — and it ran fully.

scripts/verify-all-constitution-rules.sh is present (-rwxr-xr-x 26362 bytes Jun 9 10:33). (The original 180s run was killed by timeout mid-G11; re-run with 540s timeout completed.)

Captured verdict (bash scripts/verify-all-constitution-rules.sh)

=== verify-all-constitution-rules.sh summary ===

Gates run: 14

Failures: 7

- G1 FAIL cascade verifier reported failures (see /tmp/g1-cascade.out)
- G2 FAIL production code contains bluff markers
- G3 PASS no production code imports internal/mocks
- G4 PASS no nested own-org submodule chains in any owned submodule
- G5 PASS every owned submodule has .gitignore + no sensitive files trac
- G6 PASS all top-level directories snake_case OR protected (0 protected
- G7 FAIL feature commit(s) lack docs/qa/<run-id>/ evidence (see /tmp/g7
- G8 FAIL Obsolete item(s) missing/invalid Obsolete-Details (see /tmp/g8
- G9 PASS every summary one-liner is self-contained (no anti-pattern row

```
G10 PASS no multi-platform script drops a manifest platform without ho
G11 PASS PASS – committed DB validates + md↔db byte-identical in sync
G12 FAIL summary docs stale vs Issues.md/Fixed.md – re-run scripts/gen
G13 FAIL operator-facing doc(s) lack a §11.4.99 Sources-verified foote
G14 FAIL docs_chain verify --all reported drift or error – run: docs_c
```

FAIL: 7 gate(s) violate the constitution

Overall §11.4.55 sweep verdict: FAIL (7 of 14 gates failing).

Gate details captured

- **G1** FAIL — wraps the cascade verifier (see STEP 2; 213 failures).
- **G2** FAIL — production code contains bluff markers; canonical fix cites `helix_code/cmd/cli/main.go` – replace simulation with real implementation.
- **G7** FAIL — RESULT: FAIL (enforcing – 116 violation(s)) — feature commits lacking `docs/qa/<run-id>/evidence`.
- **G8** FAIL — 0 compliant Obsolete item(s), 1 violation(s); the offending item: `docs/Fixed.md ## HXC-044 – internal/cognee: AMD-GPU rocm-smi JSON parser ... missing/invalid sub-fact(s): Reason(closed-vocab) Triple-check`.
- **G12** FAIL — Issues/Fixed summary docs stale.
- **G13** FAIL — operator-facing docs missing §11.4.99 Sources-verified footer.
- **G14** FAIL — `docs_chain verify --all` drift/error.

Note for the task framing: the task hypothesised the sweep script may be absent (“not implemented here”). That hypothesis is **disproven** — the script exists and is the live enforcement engine; it returns FAIL.

STEP 2 — `verify-governance-cascade.sh` (extended to anchors 142 → 166)

`scripts/verify-governance-cascade.sh` is present (-rwxr-xr-x 10306 bytes Jun 22 11:24).

Captured summary

```
=== Result: 213 failures ===
FAIL
```

Total lines 290 · PASS lines 63 · FAIL lines 214 (213 distinct failures + header).
Sections: Root governance, Root govfiles – covenant-114 propagation

(§11.4.69, §11.4.75..§11.4.166), Owned-by-us submodules, Third-party submodules.

Root-carrier propagation lag (which anchors each root govfile is MISSING)

```
PASS: root/CONSTITUTION.md (governance presence)    PASS: root/AGENTS.md (g
FAIL: root/CLAUDE.md          - missing: §11.4.166
FAIL: root/AGENTS.md          - missing: §11.4.159 §11.4.160 §11.4.161 §11.4.
FAIL: root/QWEN.md            - missing: §11.4.159 .. §11.4.166 (8 anchors)
FAIL: root/GEMINI.md          - missing: §11.4.159 .. §11.4.166 (8 anchors)
FAIL: root/CRUSH.md           - missing: §11.4.142 .. §11.4.166 (25 anchors)
FAIL: root/CONSTITUTION.md    - missing: §11.4.142 .. §11.4.157, §11.4.159 ..
```

So the root carriers themselves are CLOSEST to current — root CLAUDE.md lags by exactly ONE anchor (§11.4.166, the just-pulled semgrep mandate). AGENTS/QWEN/GEMINI lag from §11.4.159; CRUSH lags from §11.4.142.

Owned-by-us submodule lag

```
owned-submodule carrier files PASS: 0
owned-submodule carrier files FAIL: 207
distinct owned submodules failing: 64
```

Earliest-missing-anchor frequency across the 207 owned carriers:

```
201 carriers : earliest missing = §11.4.142    (carry through 11.4.141, mi
 6 carriers : earliest missing = far older      (e.g. submodules/doc_proce
```

The 201-carrier bulk is the “missing §11.4.142 .. §11.4.166” cohort — every owned submodule’s CLAUDE/AGENTS/CONSTITUTION trio lags the meta-repo’s most-advanced anchor set by the full 142 → 166 band. doc_processor is materially worse, missing from the CONST-047 / §11.4.98 era.

Third-party submodules

PASS — correctly excluded (listed in submodule_third_party.txt),
e.g. cli_agents/*, dependencies/*, cli_agents_resources/*, mcp_servers.

STEP 3 — git submodule status + per-submodule anchor counts

git submodule status lists **130** submodule entries total (the large majority third-party cli_agents/*, dependencies/*, cli_agents_resources/).

Requested sample carriers — all FOUND under submodules/ (flat helix_qa/, helix_agent/, llm_provider/, llms_verifier/ do NOT exist; only the submodules/<name>/ form):

Carrier (CLAUDE.md)	cnt 11.4.162	cnt 11.4.166	highest anchor present
constitution/CLAUDE.md (source of truth)	3	1	11.4.166
CLAUDE.md (root meta-repo)	2	0	11.4.165
submodules/helix_qa/ CLAUDE.md	0	0	11.4.141
submodules/helix_agent/ CLAUDE.md	2	0	11.4.162
assets/CLAUDE.md	2	0	11.4.162
submodules/llm_provider/ CLAUDE.md	0	0	11.4.141
submodules/llms_verifier/ CLAUDE.md	0	0	11.4.141

Quantified lag: - **constitution** (canonical root) — current at 11.4.166. - **root CLAUDE.md** — has 11.4.162, lacks 11.4.166; highest = 11.4.165 → lags by 1 anchor (the new semgrep §11.4.166). - **helix_agent** / **assets** — have 11.4.162, lack 11.4.166; highest = 11.4.162 → lag ~4 anchors (163 → 166). - **helix_qa** / **llm_provider** / **llms_verifier** — lack BOTH 11.4.162 and 11.4.166; highest = 11.4.141 → lag ~25 anchors (142 → 166). **Worst-lagging cohort.**

STEP 4 — Post-pull obligation: gates a full §11.4.55 sweep runs

The constitution was bumped to 4ff4985 (now includes §11.4.166 semgrep + §11.4.157 GEMINI lockstep). Per §11.4.55, on a content-changing constitution pull the project MUST run scripts/verify-all-constitution-rules.sh BEFORE the new HEAD is canonical. That sweep runs the **14 gates** enumerated above:

- G1 Governance cascade (§11.9 + CONST-047..059) [wraps verify
- G2 CONST-035 anti-bluff smoke (production code)
- G3 CONST-050(A) mock-from-production audit
- G4 CONST-051(C) nested-own-org submodule chains
- G5 CONST-053 .gitignore + sensitive-file audit
- G6 CONST-052 case-conformance (soft, phased)

G7 §11.4.83 docs/qa/ end-user evidence (HXC-019)
G8 §11.4.90 Obsolete-Details (HXC-018)
G9 §11.4.91 summary-doc clarity (HXC-018)
G10 §11.4.81 cross-platform parity (HXC-015)
G11 §11.4.93/95 workable-items md↔db sync (HXC-026)
G12 §11.4.12/91 summary-doc freshness (CM-`{ISSUES, FIXED}`-SUMMARY-SYNC)
G13 §11.4.99 Sources-verified footers (CM-SOURCES-VERIFIED; HXC-030)
G14 §11.4.106 docs_chain verify (CM-COVENANT-114-106-PROPAGATION)

Observation: the sweep's anchor coverage currently TOPS OUT at §11.4.106 (G14). It does NOT yet carry dedicated gates for the newly-pulled §11.4.157 (GEMINI lockstep), §11.4.166 (semgrep), or the 142 → 166 band beyond what G1's cascade-propagation check enforces. The propagation lag those new anchors create is caught indirectly via **G1 → verify-governance-cascade.sh** (which DID flag §11.4.166 missing on root CLAUDE.md and 142 → 166 missing fleet-wide), but no per-mandate runtime gate (e.g. a semgrep-wired gate for §11.4.166) is present in this sweep.

Bottom line

- §11.4.55 sweep script: **PRESENT and FUNCTIONAL** — verdict **FAIL (7/14 gates)**.
- Cascade verifier: **FAIL — 213 failures** (63 PASS).
- Worst-lagging carriers: every owned submodule (64 distinct, 207 carrier files) — bulk cohort missing §11.4.142 → 166 (25 anchors); helix_qa / llm_provider / llms_verifier worst at highest=11.4.141.
- Root carriers are closest: root CLAUDE.md lags by just §11.4.166; AGENTS/QWEN/GEMINI from §11.4.159; CRUSH from §11.4.142.
- A genuine post-pull cascade (CONST-047 recursive propagation of §11.4.142 → 166 incl. §11.4.157 GEMINI lockstep + §11.4.166 semgrep) is OWED across the whole fleet before 4ff4985 can be treated as canonical.
